Harness the Sun to Charge into the Future

DEVI AHILYA HOUSE

EVCRUISE

PROBLEUMS WITH EV

01

One major issue is their limited battery life; a fully charged lithium-ion battery typically lasts only 3-8 hours and provides a range of 200 to 250 kilometers.

02

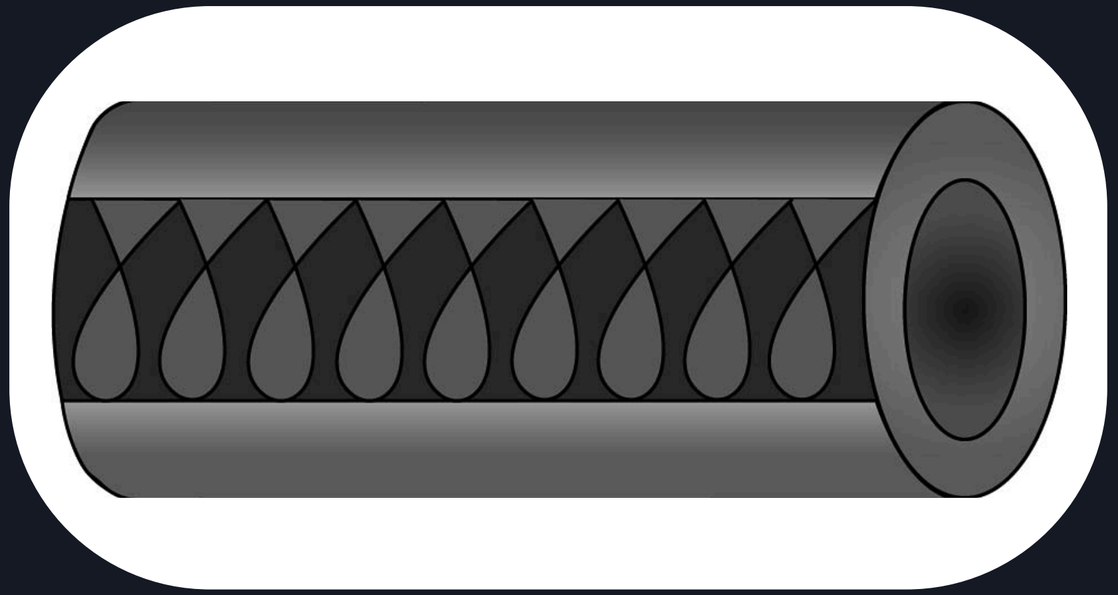
The sparse availability of charging stations exacerbates this problem, making it challenging to travel even short distances between cities.

03

After 5-6 years, their disposal contributes to hazardous environmental damage,

EVCRUISE

MODULUS



A HIGH-TECH ENERGY RESERVOIR.

- The modulus on the outside is encased in rugged alloyed steel.
- Inside, we have a graphene conductive sheet.
- On the right side, we connect the wires from the solar panels, and on the left, we hook it up to the EV’s lithium-ion battery.
- Electrons travel through the modulus and get trapped on special patches of reduced graphene oxide. These electrons can then be released on demand to give a power boost to the lithium-ion battery.

EVCRUISE

GRAPHENE

- It will be in the form of thin and flexible sheets that are strong but also lightweight
- It has high resistance to wear and tear and excellent conductivity, which contributes to its several other beneficial properties
- The cost effectiveness of this material compared to other conductive materials works in our favor.

EVCRUISE

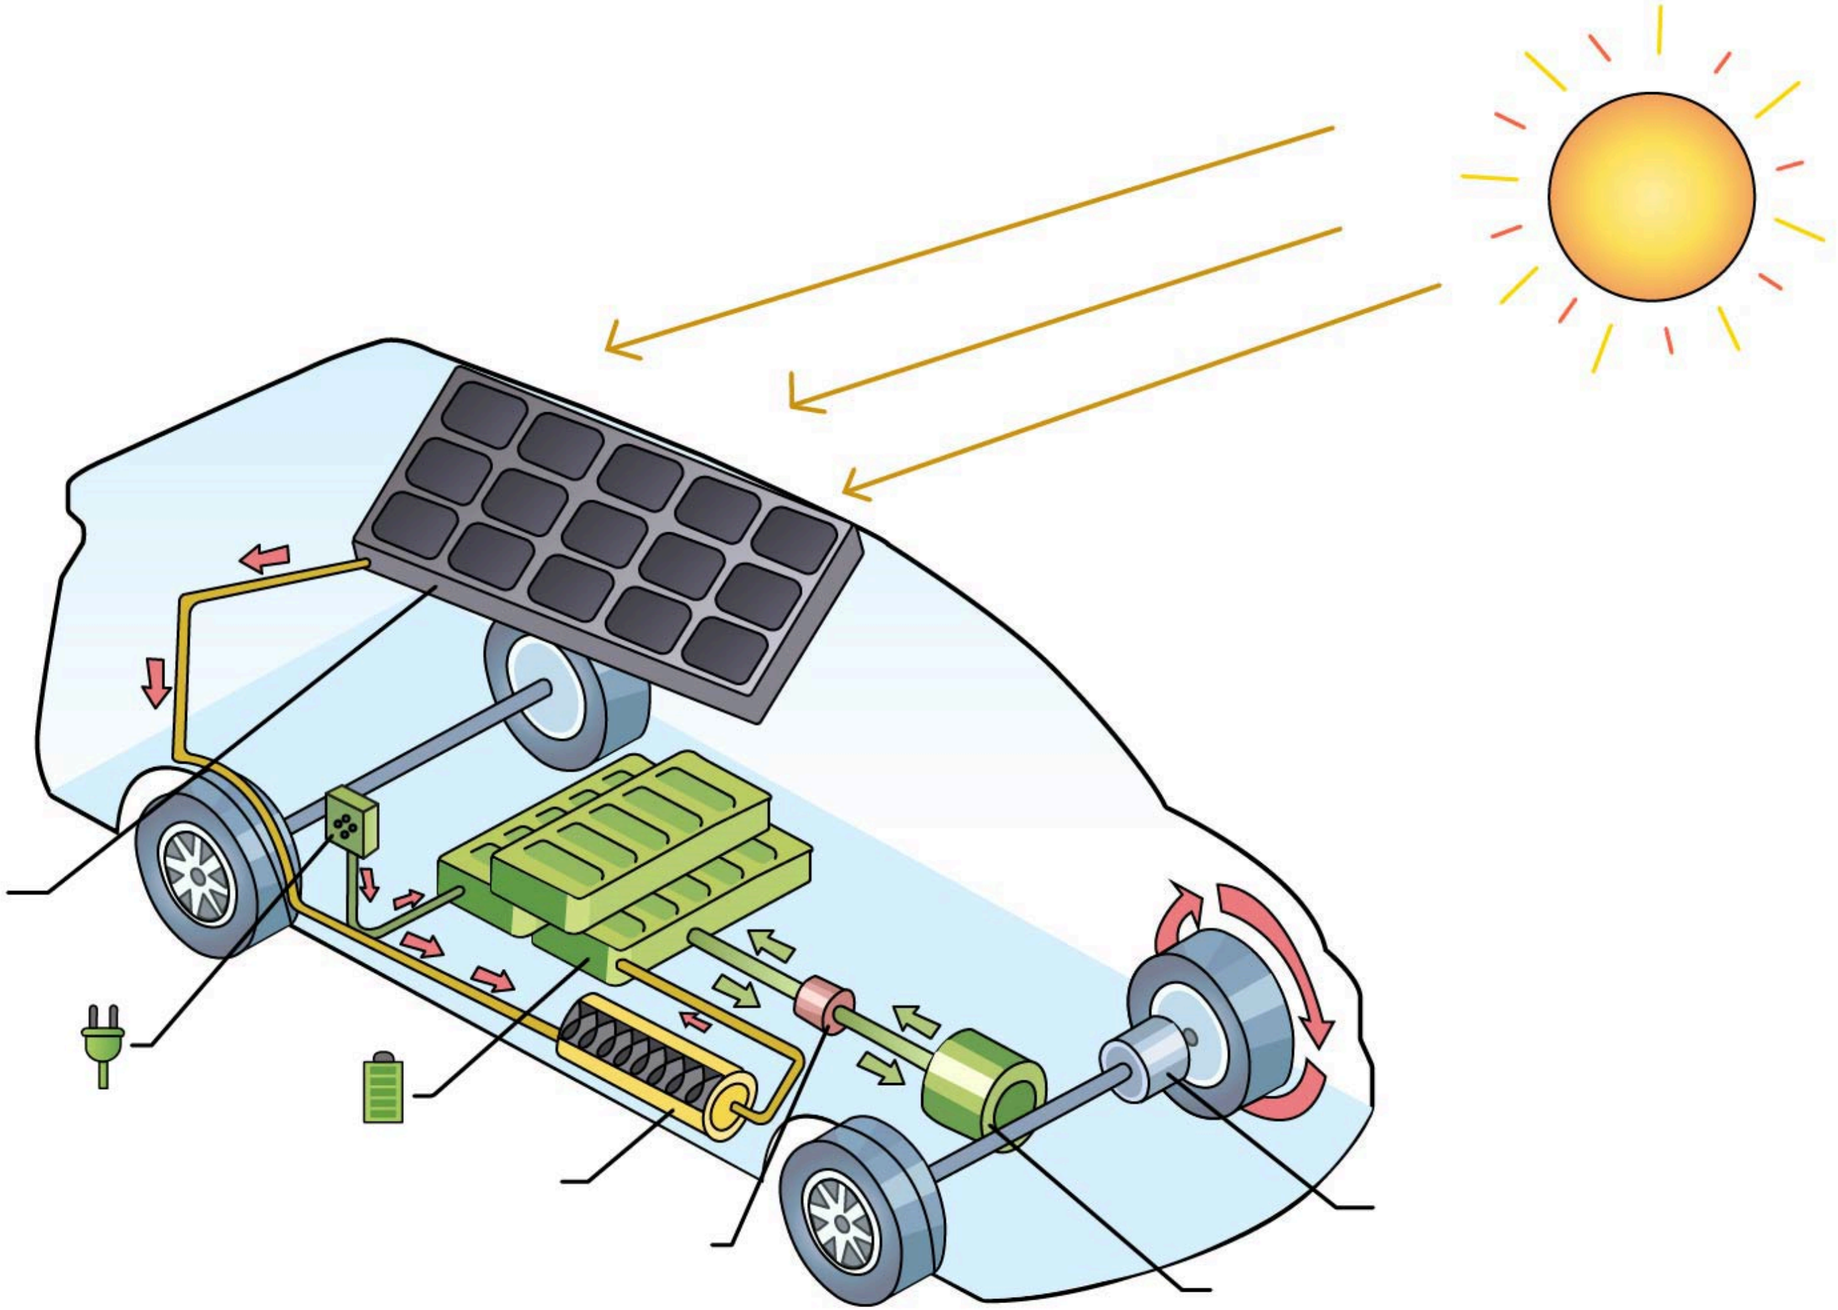
LAB EXPERIMENT

EVCRUISE

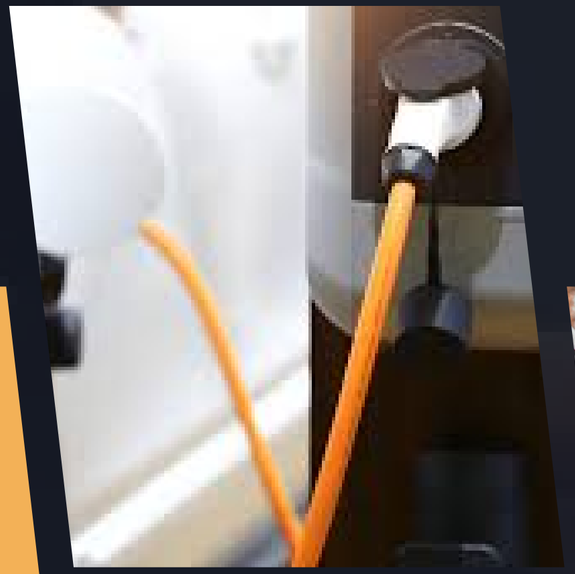
STEPS FOR INSTALLATION

1. Disconnect the car’s battery and any existing roof features.
2. Install solar panels using mounting hardware and adhesive connect the wiring to the panels and route it through the roof to the modulus under the car’s floor.
3. Position the modulus under the car floor with the correct brackets and mounts.
4. Connect the input conductor to the solar panel wires and the output to the lithium-ion battery.
5. Reconnect the battery and test drive the car with a 0% battery charge to confirm everything is functioning correctly

EVCRUISE



EVCRUISE



PROBLEMS IT SOLVES

01

Increases the lifespan of lithium-ion batteries by 150% and halves the environmental damage caused by the batteries.

02

Removes dependence on fossil fuel hybrid cars.

03

Drastically increases the mileage to ensure that you have a long and green journey wherever you go.

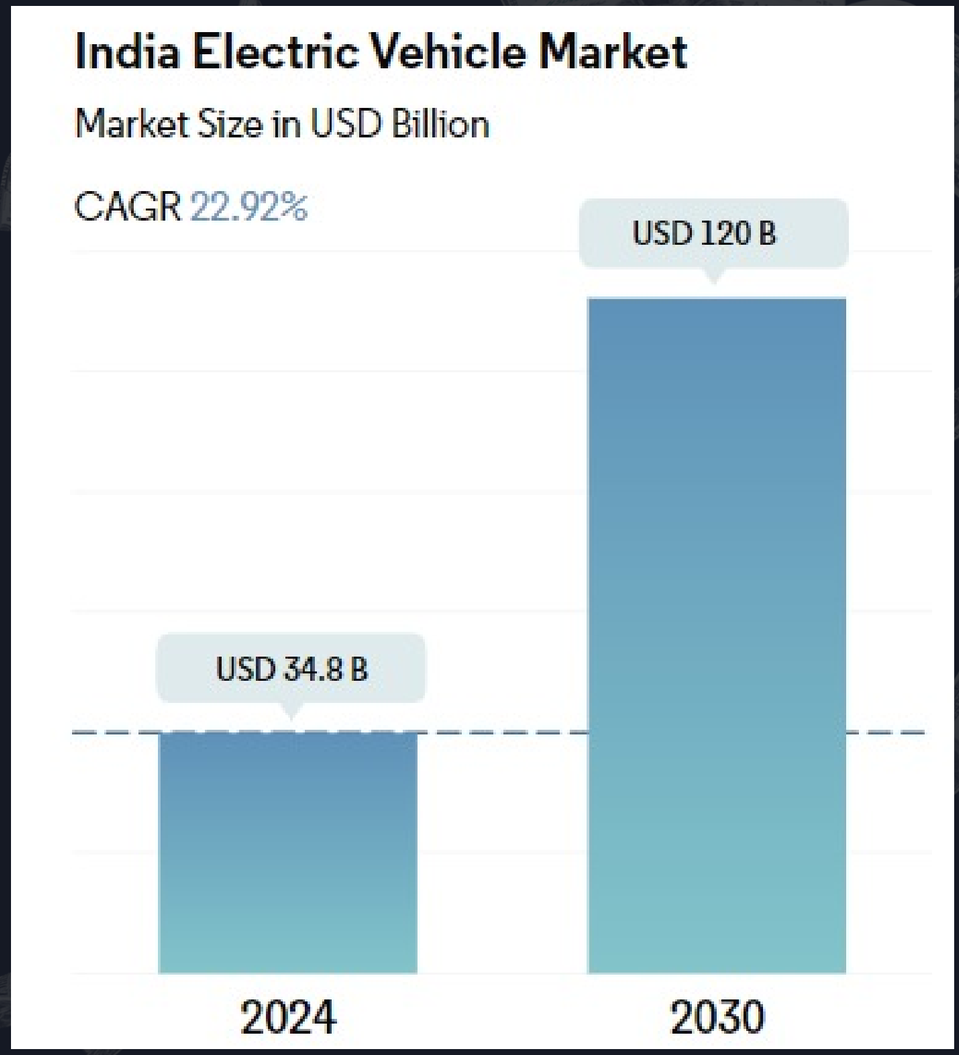
MARKET SIZE AND OVERVIEW

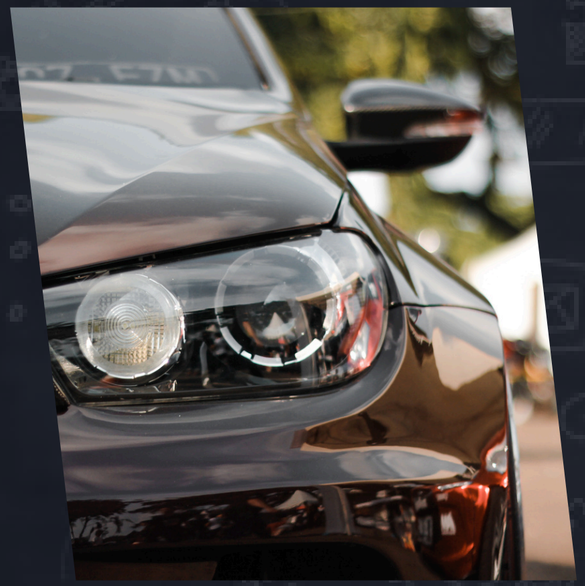
CAGR (Compounded Annual Growth Rate) of Indian EV Market - **22.92%**

Market Size - **$34.8 billion**



EVCRUISE

MARKETING



Advertisement -

- Electronic and print media like TV ads and newspaper or magazine ads
- Prime time cost: 50000 per minute
- Non- prime time cost: 30000 per minute
- Early morning cost: 10000 per minute

Social Media -

- Instagram, Linkedin, Twitter:
- Constant updates about advancements
- Benefits and performance improvements
- Customer reviews
- In-house social media marketing

Community Engagement -

- World Environment Expo, 2025
- Under pollution control equipments and technology

EVCRUISE

MARKETING

Events and Trade Shows

India EV Show-a premier event fostering innovation and collaboration in the electric mobility sector.

Benefits:

- Showcase the innovation
- Networking with industry leaders, potential customers
- Industry insights
- Live demonstrations of the product

Business to Business (B2B)

- Approach key stakeholders
- Form alliances or partnerships with EV manufacturers
- Linked in Ads and re-target website visitors
- Content Marketing
- Search Engine Optimization
- Account-Based Marketing (ABM)
- Analytics and Testing

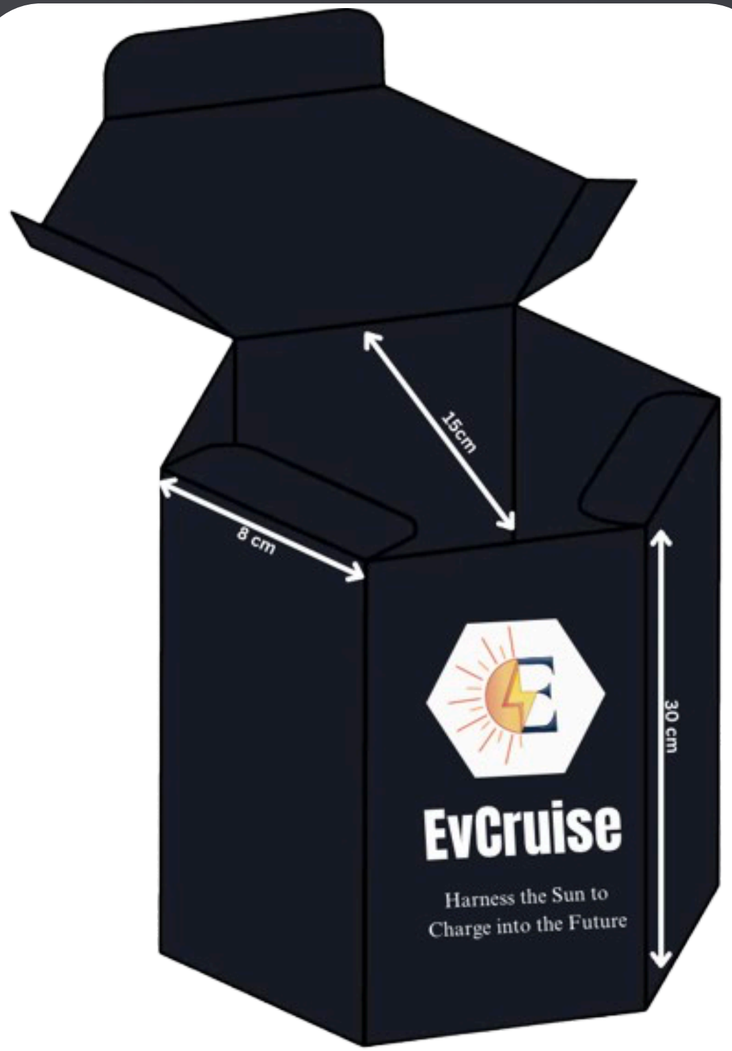
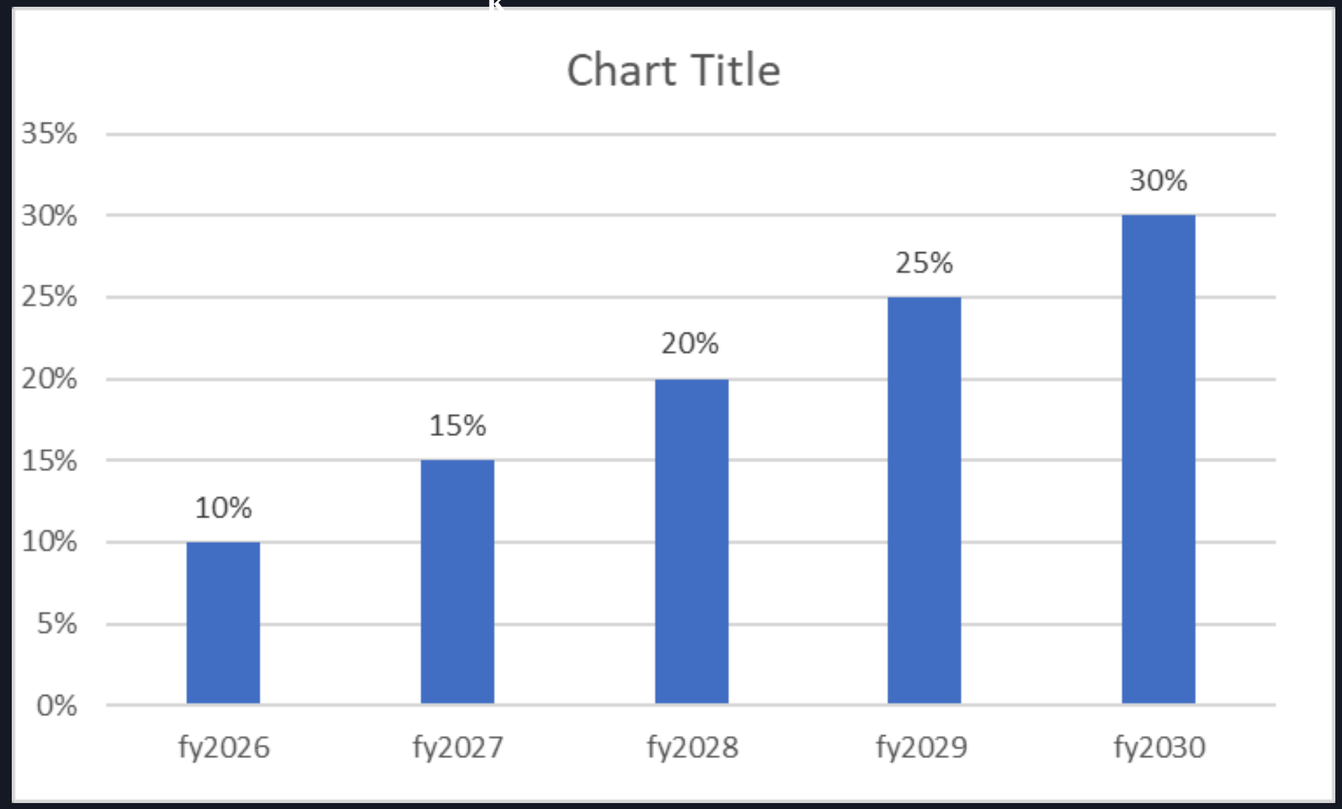
PACKAGING



EVCRUISE

PREDICTED YOY SALES GROWTH

FY 2026	10%
FY 2027	15%
FY 2028	20%
FY 2029	25%
FY 2030	30%



OUR VISION

01

Providing services directly to consumers

02

Opening a graphene factory using charred sugarcane to produce graphene

03

Manufacturing our own electric cars.

04

Going Global
